Your ear problem may be helped by a tympano-ossiculoplasty. As with any surgery, there are gains but also risks. You must keep in mind that your hearing may be worse after surgery. The following information will help you understand the results and risks of tympano-ossiculoplasty.

**Hearing Loss:**
Although 80% of patients experience hearing improvement, 19% have the same hearing and 1% have a further or complete loss of hearing.

**Dizziness:**
Temporary dizziness lasting up to a month happens in 5% of patients; however, permanent dizziness happens in only 1 out of 1,000 patients. Dizziness is usually caused by erosion into the balance system from infection.

**Taste Disturbances and Mouth Dryness:**
The nerve that supplies one-third of the taste to the tongue runs through the middle ear and may have to be pushed aside or cut in order to do a tympano-ossiculoplasty. Therefore, a temporary taste disturbance occurs in 10% of patients and can last as long as one year. Permanent taste disturbance and dryness of the mouth may occur in 1% of patients.

**Tinnitus:**
Tinnitus (noise in the ear or head) is often present in patients with a hearing loss; therefore, many patients already have tinnitus before surgery. After surgery tinnitus is often reduced but can be unchanged or, in rare cases, worse. Occasionally, patients that did not have tinnitus before surgery will develop it following surgery.

**Facial Paralysis:**
The facial nerve controls movement on one side of the face and runs through the middle ear. A temporary paralysis of the face lasting several days, is seen in 1% of patients. Permanent paralysis of the face is very rare, but may occur in 1 out of 1,000 patients.

**Perforation:**
Our purpose is to close the ear drum hole (perforation), but not all patients heal the same and the hole may reappear. About 95% of patients have an intact ear drum after surgery, but 5% develop another perforation and require revision surgery. Following revision surgery, 3 out of 4 patients will heal with an intact ear drum.

**Infection:**
The major purpose of this surgery is to remove infection, and the chance of infection clearing is 95%. The remaining 5% of patients may still have some trouble with infection after the surgery and a second stage surgery may be necessary in roughly one year.

*Our goal in performing a tympano-ossiculoplasty is to provide you with the best chance for success with the least risk of failure. Like other aspects of life, there are no guarantees. If you have a bad result after surgery, we will do our best to treat the problem. Please let Dr. Fucci or our staff know if you have questions.*

**Informed Consent**

*Our intent is to make sure you understand your or your child’s ear surgery.*

(Please Circle)

1. Do you understand the type of surgery you will have?
   Yes   No

2. Do you know the purpose of the surgery?
   Yes   No

3. Were you told what we expect to accomplish?
   Yes   No

4. Do you have a copy of *Tympano-Ossiculoplasty - Results & Risks*?
   Yes   No

5. Have you read *Tympano-Ossiculoplasty - Results & Risks*?
   Yes   No

6. Do you understand *Tympano-Ossiculoplasty - Results & Risks*?
   Yes   No

7. Do you understand there are no guarantees?
   Yes   No

8. Are you satisfied that all your questions have been answered?
   Yes   No

9. Are you allergic to any medications?
   Yes   No

If yes, please list:
